# 1. What Is UpMyRank?

UpMyRank is an AI-powered tutoring platform for Indian students preparing for JEE (engineering) and NEET (medicine) entrance exams. It covers Physics, Chemistry, and Maths at NCERT Class 11 and Class 12 level. The platform serves students preparing for the most competitive undergraduate entrance exams in India — approximately 1.5 million students attempt JEE each year.

## Core Thesis

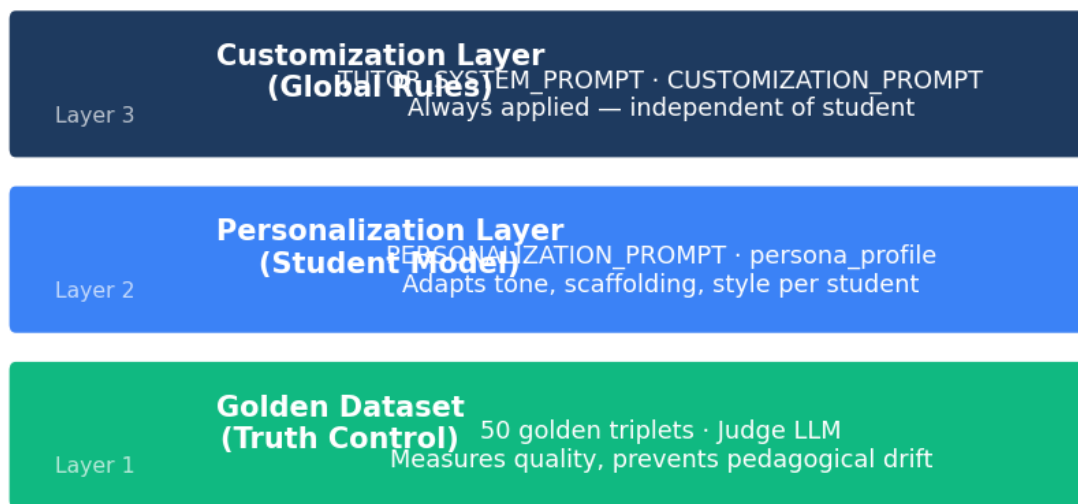

The problem with AI tutoring is not intelligence — it is pedagogy. Most AI tools simply give students the answer. UpMyRank refuses to do this. Instead, every response is generated through a Socratic engine that forces the student to think before receiving the next level of assistance. The system tracks what the student knows, how quickly they forget, and where their misconceptions lie — then adapts the teaching style accordingly.

| Principle          | What It Means                                                                          | Why It Matters                                    |
|--------------------|----------------------------------------------------------------------------------------|---------------------------------------------------|
| Pedagogy-first AI  | Every response deliberately withholds the answer until the student demonstrates effort | Desirable difficulty is not a bug, it's a feature |
| Adaptive Memory    | Per-student Knowledge Genome tracks mastery via spaced repetition                      | Stops forgetting the product of learning          |
| Measurable Quality | 4-dimension LLM judge evaluates every session against golden dataset                   | Teaches golden, not just answer faster            |

---

## 2. The PTB Educational AI Framework

PTB (Python Tutor Bot) is the educational AI framework underlying UpMyRank. It provides a structured three-layer architecture that separates global rules from per-student adaptation and from quality measurement. The key insight is that the LLM is not the intelligence — the architecture is.

*LLM is a composer — the system architecture is the product*

Figure: PTB three-layer architecture

### Layer Details

**Layer 1 — Customization (Global Rules):** TUTOR\_SYSTEM\_PROMPT + CUSTOMIZATION\_PROMPT.

Defines what the AI always does, regardless of which student it is talking to. This is the global pedagogy contract: always Socratic, never give the answer directly, always cite NCERT.

**Layer 2 — Personalization (Student Model):** PERSONALIZATION\_PROMPT + persona\_profile. Adapts tone, scaffolding depth, preferred teaching style, and hint depth based on the individual student's onboarding profile and session history.

**Layer 3 — Golden Dataset (Truth Control):** 50 golden triplets + Judge LLM (gpt-4o-mini at temperature=0). Measures pedagogical quality on every session and fires pre-deploy regression gates. Prevents quality drift over time.

### Core Philosophy

- The LLM is a composer, not the source of knowledge. The system architecture is the product.
- Optimize for learning gain, not user satisfaction. Desirable difficulty is intentional.
- Policy Engine first — always determine HOW to teach before generating a response.
- Misconceptions ≠ knowledge gaps. Wrong thinking requires different treatment than wrong answers.

- Measure pedagogy, not just accuracy. Judge LLM scores Socratic quality on every response.

### 3. The Build Journey — 10 Phases

UpMyRank was built in 10 sequential phases, each adding a distinct architectural layer. The sequence reflects a deliberate strategy: get the Socratic loop right first, then add memory, then add evaluation, then add personalization.

| Phase                              | What Was Built                                                                         | Key Files                                                                               |
|------------------------------------|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Phase 0<br>Foundation              | FastAPI app, asyncpg pool, Supabase Postgres, Dockerfile, database schema              | app/main.py<br>scripts/setup_db.sql                                                     |
| Phase 1<br>Socratic Engine         | Hint ladder (levels 0–4), intent classification, forced-attempt gate, LaTeX sanitizer  | app/services/doubt/engine.py<br>app/services/doubt/prompts.py                           |
| Phase 2<br>Knowledge Genome        | Per-concept EMA mastery tracking, doubt_blocks, session lifecycle                      | app/api/doubt.py<br>app/api/session.py                                                  |
| Phase 3<br>Agentic RAG             | 4-tool agentic retriever, hybrid RRF search, pgvector/HNSW index                       | app/services/rag/agent.py<br>app/services/rag/tools.py<br>app/services/rag/retriever.py |
| Phase 4<br>Student Memory          | 3-layer memory (Redis + Postgres + concept mastery), session summarizer                | app/services/memory/context.py<br>app/services/memory/summarizer.py                     |
| Phase 5<br>Policy Engine           | scaffolding_level inference, PedagogyConfig, subject-specific policy logic             | app/services/policy/engine.py                                                           |
| Phase 6<br>Misconception Detection | 30-entry library, 1.5× mastery penalty, misconception-interference model               | app/services/doubt/misconceptions.py                                                    |
| Phase 7<br>Eval + Judge            | 4-dimension LLM judge, judge_evaluations table, regression gate, eval dashboard        | app/services/eval/judge.py<br>scripts/regression_gate.py                                |
| Phase 8<br>Onboarding + Persona    | 4-step UI onboarding, GPT-4.1-mini persona builder, persona evolution every 5 sessions | app/api/onboarding.py<br>frontend/web/app/onboarding/page.tsx                           |
| Phase 9<br>Performance             | Pre-computed embeddings, parallel tool dispatch, pg_trgm GIN indexes, concept seeding  | app/services/rag/agent.py<br>scripts/migrate_v14_perf_indexes.sql                       |

---

## 4. Technology Stack

Every technology choice is driven by the educational AI requirements: async-first for streaming, vector similarity for RAG, EMA for mastery tracking, and no ORM to keep raw query control for complex pgvector operations.

| Layer              | Technology                                      | Notes                                                           |
|--------------------|-------------------------------------------------|-----------------------------------------------------------------|
| Backend            | FastAPI (Python 3.11), asyncpg, Pydantic        | Async-first, no ORM                                             |
| Primary LLM        | gpt-4.1-mini                                    | Socratic responses, hints, solutions, persona builder           |
| Classification LLM | gpt-4o-mini                                     | Intent classification, summarization, memory compression, judge |
| Vision LLM         | gpt-4o                                          | Image extraction only — never used for text generation          |
| Vector DB          | pgvector 0.8.2 on Postgres 16                   | HNSW index, 1536-dim embeddings, cosine distance                |
| Embeddings         | text-embedding-3-small                          | All tables uniform, 1536 dimensions                             |
| Cache              | Redis (redis.asyncio)                           | Hot context 48h TTL, semantic cache cosine 0.92                 |
| Token counting     | tiktoken cl100k_base                            | Prompt token budgets                                            |
| Frontend           | Next.js 14, TypeScript, Tailwind, Framer Motion | SSR for client components, SSE streaming                        |
| Package manager    | Poetry (.venv in-project)                       | Python 3.11.14 from Miniconda                                   |
| Config             | pydantic-settings, .env                         | DATABASE_URL, OPENAI_API_KEY, REDIS_URL                         |
| Backend hosting    | Render.com                                      | Auto-deploy from main branch                                    |
| Frontend hosting   | Vercel                                          | Edge CDN, Next.js native                                        |
| DB hosting         | Supabase (Postgres + RLS)                       | aws-0-us-west-2.pooler.supabase.com                             |

---

## 5. Backend Architecture

### Application Startup Sequence

FastAPI uses a lifespan context manager to initialize all shared services in a guaranteed order. Every service is stored on `app.state` so it is accessible to all route handlers without global singletons.

Figure: Lifespan startup — services initialized in dependency order

### API Routers

| Router | Prefix  | Key Endpoints                  |
|--------|---------|--------------------------------|
| health | /health | GET /                          |
| auth   | /auth   | POST /login, /signup, /refresh |

|            |             |                                                 |
|------------|-------------|-------------------------------------------------|
| onboarding | /onboarding | POST /submit, GET /status                       |
| admin      | /admin      | GET /metrics, GET /is_admin, GET /judge-metrics |
| doubt      | /doubt      | POST /ask/stream, POST /verify                  |
| feedback   | /feedback   | POST /response                                  |
| session    | /session    | POST /start, /end, /resume                      |
| student    | /student    | GET /{id}                                       |
| mock       | /mock       | POST /start, GET /submit                        |
| taxonomy   | /taxonomy   | GET /chapters                                   |

## 6. The Socratic Engine

The Socratic Engine is the heart of UpMyRank. Every student question passes through this pipeline, which decides what kind of response the student should receive — and deliberately withholds information until the student demonstrates effort.

Figure: Full question-processing pipeline in the Socratic Engine

### Intent Types

| Intent         | Trigger                                   | Response Path                                                |
|----------------|-------------------------------------------|--------------------------------------------------------------|
| CONVERSATIONAL | "yes", "ok", "thanks", short affirmatives | CONVERSATIONAL_RESPONSE — no session started                 |
| EXPLANATION    | "explain X", "what is X"                  | EXPLANATION_PROMPT — direct structured explanation, bypasses |
| OUT_OF_SCOPE   | non-Physics/Chem/Maths topics             | Polite rejection with subject scope reminder                 |

|              |                               |                                                                         |
|--------------|-------------------------------|-------------------------------------------------------------------------|
| SOCRATIC     | First question on a concept   | Hint Level 0: Socratic question only — no formula, no clue              |
| CONTINUATION | Follow-up in existing session | <code>get_hint()</code> → escalate hint level based on student progress |

## 7. The Hint Ladder

The hint ladder is the core of the Socratic method. It has 5 levels (0–4). The student starts at Level 0 and advances only when they demonstrate genuine effort. Level 3 is structurally enforced — it is not just a stricter instruction but a different system prompt with all RAG context removed.

*Hint depth increases → more scaffolding revealed*

Figure: Hint ladder — each level reveals more scaffolding

| Level | Name                 | What the AI Does                                                                           | What the Student Must Do                    |
|-------|----------------------|--------------------------------------------------------------------------------------------|---------------------------------------------|
| 0     | Socratic Question    | Asks a probing question to activate prior knowledge.                                       | Think. Form a hypothesis. Write something.  |
| 1     | Conceptual Bridge    | Connects the question to a related concept the student already knows.                      | Should already know the bridge concept.     |
| 2     | Formula/Method Guide | Reveals the relevant formula or method structure.                                          | Attempt substitution and derive the answer. |
| 3     | FORCED ATTEMPT       | Context starved. Prompt swapped. AI: "You have 10 minutes to solve this." (No RAG context) | Write a full attempt. No escape hatch.      |
| 4     | Full Solution        | Step-by-step worked solution only after genuine attempt.                                   | Review and compare against your attempt.    |

**Level 3 Implementation Note:** Level 3 is not enforced through instructions alone — the system prompt is completely swapped to `SYSTEM_PROMPT_FORCED_ATTEMPT`, all RAG context is cleared before the LLM call, and intent classification is skipped. This structural enforcement is necessary because LLMs can ignore instructional constraints under pressure. Context starvation makes it structurally impossible to give the answer.

## 8. Agentic RAG System

The Agentic RAG system uses an LLM-driven tool selection loop to retrieve the most relevant context for each question. Rather than always searching all sources, the agent decides which combination of tools to use based on the question and subject.

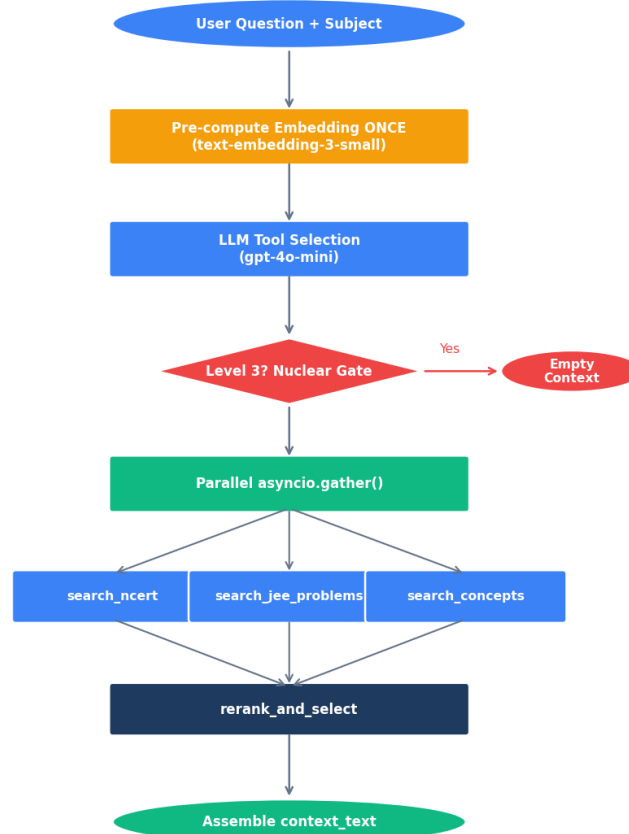

Figure: Agentic RAG retrieval pipeline

### The 4 Tools

| Tool               | Purpose                                               | Search Method                                                         |
|--------------------|-------------------------------------------------------|-----------------------------------------------------------------------|
| search_ncert       | Find NCERT textbook passages relevant to the question | Hybrid RRF of BM25 or cosine + pg_trgm ILIKE, fused with Reciprocal F |
| search_jeeproblems | Find similar JEE Previous Year Questions              | Vector similarity on 1536-dim embeddings, HNSW index                  |
| search_concepts    | Look up concept definitions in the taxonomy           | pg_trgm GIN index on subtopic/description                             |

|                   |                                                   |                                                                     |
|-------------------|---------------------------------------------------|---------------------------------------------------------------------|
| rerank_and_select | Select the best chunks from all retrieved results | Embeds results and reranking using precomputed embedding similarity |
|-------------------|---------------------------------------------------|---------------------------------------------------------------------|

Hybrid RRF Formula

Each candidate gets:  $\text{rrf\_score} = 1/(\text{k} + \text{vector\_rank}) + 1/(\text{k} + \text{text\_rank})$  where  $\text{k}=60$ . Vector rank from pgvector cosine distance. Text rank from ILIKE pg\_trgm GIN match. Final top-K selected by descending rrf\_score. The RRF fusion approach means neither pure vector nor pure keyword dominates — exact formula name matches are boosted by text rank while semantic relevance is captured by vector rank.

Performance Optimizations

| Optimization              | Before                                 | After                                    | Improvement                         |
|---------------------------|----------------------------------------|------------------------------------------|-------------------------------------|
| Embedding calls per query | 3 separate API calls (~300-700ms each) | Is pre-computed, shared across all tools | ~60-70% latency reduction           |
| Tool dispatch             | Sequential (tool1 → tool2 → tool3)     | Parallel asyncio.gather()                | ~50% reduction for multi-tool steps |
| ILIKE search              | Full table scan on 14,384+ rows        | pg_trgm GIN index                        | $O(n) \rightarrow O(\log n)$        |
| Combined P95 latency      | ~12,677ms                              | Target <2,000ms                          | ~84% improvement                    |

---

## 9. Database Schema

The database runs on Postgres 16 hosted on Supabase with pgvector 0.8.2 for vector similarity search. All 14 tables have Row Level Security (RLS) enabled. Schema evolves through numbered migration files — never ad-hoc ALTER TABLE.

### Table: students

One row per registered student. Source of truth for identity, onboarding state, and exam target.

| Column               | Type        | Notes                     |
|----------------------|-------------|---------------------------|
| id                   | UUID PK     | Supabase auth.users FK    |
| email                | TEXT UNIQUE | Login identifier          |
| name                 | TEXT        | Display name              |
| exam_type            | TEXT        | 'JEE' or 'NEET'           |
| class_level          | TEXT        | '11th', '12th', 'dropper' |
| physics_prev_marks   | SMALLINT    | 0-100, from onboarding    |
| study_hours_per_day  | SMALLINT    | From onboarding           |
| exam_date            | DATE        | Target exam date          |
| onboarding_completed | BOOLEAN     | Gate for app access       |
| created_at           | TIMESTAMPTZ | Auto                      |

### Table: study\_sessions

One row per study session. Contains the GPT-compressed summary and topics covered.

| Column           | Type        | Notes                             |
|------------------|-------------|-----------------------------------|
| study_session_id | UUID PK     |                                   |
| student_id       | UUID FK     | → students.id                     |
| started_at       | TIMESTAMPTZ | Session start                     |
| ended_at         | TIMESTAMPTZ | NULL if active                    |
| doubt_count      | INT         | Running count                     |
| session_summary  | TEXT        | GPT-4o-mini compressed summary    |
| topics_covered   | TEXT[]      | All topics addressed this session |

### Table: doubt\_blocks

One row per question asked. Tracks hint progression, misconception detection, and resolution.

| Column                 | Type     | Notes                            |
|------------------------|----------|----------------------------------|
| doubt_block_id         | UUID PK  |                                  |
| study_session_id       | UUID FK  |                                  |
| doubt_session_id       | UUID FK  | → doubt_sessions.id              |
| topic                  | TEXT     | Question topic string            |
| subject                | TEXT     | 'Physics', 'Chemistry', 'Maths'  |
| hint_level             | SMALLINT | 0-4, current depth               |
| solved                 | BOOLEAN  | Student marked resolved          |
| misconception_detected | BOOLEAN  | From misconception library check |
| misconception_id       | TEXT     | Matched misconception key        |

### Table: knowledge\_chunks

15,069 NCERT passage chunks. Physics (10,505) + Chemistry (3,138) + Maths (1,426).

| Column      | Type         | Notes                                 |
|-------------|--------------|---------------------------------------|
| id          | UUID PK      |                                       |
| content     | TEXT         | NCERT passage text (350-token chunks) |
| subject     | TEXT         | 'Physics', 'Chemistry', 'Maths'       |
| chapter     | TEXT         | Chapter name                          |
| class_level | TEXT         | '11' or '12'                          |
| chunk_index | INT          | Position within chapter               |
| embedding   | vector(1536) | text-embedding-3-small                |

### Table: concept\_mastery

Per-student per-concept mastery. The Knowledge Genome. Sole writer: \_genome\_update\_task.

| Column     | Type    | Notes |
|------------|---------|-------|
| student_id | UUID FK |       |

|                   |                          |                                |
|-------------------|--------------------------|--------------------------------|
| concept_id        | TEXT FK                  | → concepts.id                  |
| mastery_score     | FLOAT                    | EMA, 0.0–1.0                   |
| error_fingerprint | JSONB                    | {error_type: strength 0.0–1.0} |
| forgetting_rate   | FLOAT                    | Ebbinghaus decay, 0.1–0.9      |
| last_practiced    | TIMESTAMPTZ              |                                |
| PRIMARY KEY       | (student_id, concept_id) |                                |

### Table: student\_memory

Rolling compressed profile + full persona JSON. Evolves every 5 sessions.

| Column                     | Type        | Notes                                              |
|----------------------------|-------------|----------------------------------------------------|
| student_id                 | UUID PK FK  |                                                    |
| compressed_profile         | TEXT        | GPT-4o-mini rolling profile, ≤120 words            |
| persona_profile            | JSONB       | Full persona dict (scaffolding_level, style, etc.) |
| persona_profile_updated_at | TIMESTAMPTZ | Staleness tracking                                 |
| forgetting_rates           | JSONB       | {concept_id: rate} mirror for fast reads           |
| sessions_since_compress    | INT         | Trigger: compress every 5 sessions                 |

### Table: session\_events

Per-turn telemetry. Captures scaffolding scores, retrieval quality, and latency.

| Column               | Type     | Notes                            |
|----------------------|----------|----------------------------------|
| id                   | UUID PK  |                                  |
| doubt_block_id       | UUID FK  |                                  |
| event_type           | TEXT     | 'hint_requested', 'solved', etc. |
| scaffolding_score    | SMALLINT | 0-2 from Judge LLM               |
| retrieval_similarity | FLOAT    | Top chunk cosine similarity      |
| response_latency_ms  | INT      | End-to-end response time         |
| hint_was_useful      | BOOLEAN  | Feedback signal                  |

### Table: judge\_evaluations

4-dimension judge scores. Populated async after session end.

| Column                     | Type     | Notes                        |
|----------------------------|----------|------------------------------|
| id                         | UUID PK  |                              |
| pedagogical_score          | SMALLINT | 0-2 (weight 0.40)            |
| factual_score              | SMALLINT | 0-1 (weight 0.30)            |
| context_relevance_score    | SMALLINT | 0-1 (weight 0.15)            |
| hint_appropriateness_score | SMALLINT | 0-1 (weight 0.15)            |
| overall_score              | FLOAT    | Weighted composite 0.0–1.0   |
| rationale_json             | JSONB    | Per-dimension rationale text |

**Table: jee\_problems**

20 verified JEE PYQs with embeddings for similarity search.

| Column     | Type         | Notes                          |
|------------|--------------|--------------------------------|
| id         | UUID PK      |                                |
| question   | TEXT         | Problem text                   |
| answer     | TEXT         | Correct answer                 |
| subject    | TEXT         | Subject tag                    |
| year       | INT          | JEE year                       |
| difficulty | TEXT         | easy/medium/hard               |
| embedding  | vector(1536) | For similarity search via HNSW |

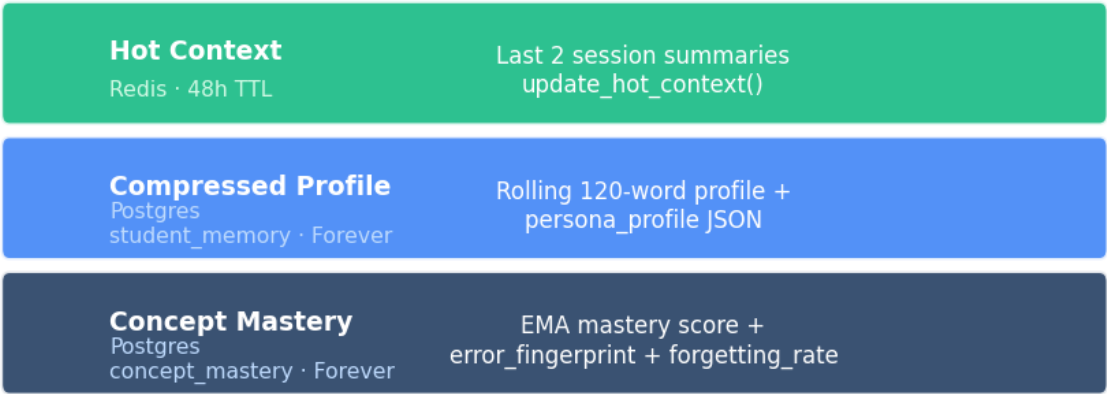

## Migration Timeline

# 10. 3-Layer Student Memory

The student memory system uses three layers with different speeds and lifetimes. Together they give the AI full context without overwhelming token budgets: hot recent summaries from Redis, compressed profile from Postgres, and per-concept mastery scores.

Layers stack: each session reads all three, writes to appropriate layer

Figure: 3-layer memory architecture

| Layer              | Storage                  | TTL      | Written By                                    | Read By                                         |
|--------------------|--------------------------|----------|-----------------------------------------------|-------------------------------------------------|
| Hot Context        | Redis                    | 48 hours | update_hot_context() on session end           | build_context_bundle()                          |
| Compressed Profile | Postgres student_memory  | Forever  | maybe_compress_profile() every 5 sessions     | build_context_bundle()                          |
| Concept Mastery    | Postgres concept_mastery | Forever  | _genome_update_task in doubt.py (sole writer) | build_context_bundle() → top 5 weakest concepts |

## persona\_profile JSON Structure

The persona\_profile is a JSONB column on student\_memory. It is built during onboarding and partially rewritten every 5 sessions by maybe\_compress\_profile(). Structured keys are preserved via dict merge — only persona\_summary is ever fully overwritten.

```
{
  "scaffolding_level": "HIGH | MEDIUM | LOW",
  "preferred_style": "analogy | formula | example | visual",
  "common_misconceptions": ["string", ...],
  "allowed_hint_depth": 3,
  "interaction_depth_score": 0.0,
  "learning_velocity": 0.0,
  "persona_summary": "3-4 sentence student description"
}
```

## Persona Evolution (Every 5 Sessions)

- Onboarding builds the initial `persona_profile` from survey answers via GPT-4.1-mini
- Every 5 sessions: `maybe_compress_profile()` fires as background task from `/session/end`
- Uses last 10 session summaries + top 10 concept mastery scores as input
- Two GPT-4o-mini calls: (1) update `compressed_profile` paragraph, (2) rewrite `persona_summary`
- Preserves all structured keys (`scaffolding_level`, `preferred_style`, etc.) via dict merge — never fully overwrites
- `persona_profile_updated_at` tracks freshness; `format_context_for_prompt()` adds staleness warning if >15 sessions old

---

## 11. Policy Engine

The Policy Engine is a separate architectural layer that runs before every LLM call. It produces a PedagogyConfig dataclass that determines HOW to teach — independent of WHAT to teach. Separating these concerns is the key architectural decision that makes pedagogy deterministic and auditable.

### Scaffolding Level Inference

| avg_mastery Range | scaffolding_level | Teaching Style                                                       |
|-------------------|-------------------|----------------------------------------------------------------------|
| < 0.4             | HIGH              | Explicit, step-by-step, analogies, check-ins after each concept      |
| 0.4 – 0.7         | MEDIUM            | Formula-focused, neutral tone, moderate pacing                       |
| > 0.7             | LOW               | Application problems, high density, direct tone, minimal scaffolding |

### Subject-Specific Overrides

| Subject   | HIGH       | MEDIUM      | LOW         | Special Rules                                                      |
|-----------|------------|-------------|-------------|--------------------------------------------------------------------|
| Physics   | conceptual | formula     | application | None                                                               |
| Chemistry | conceptual | formula     | application | HIGH: use_analogies=False<br>(equations are the intuition vehicle) |
| Maths     | conceptual | application | application | max_concepts -= 1<br>(each step needs verification)                |

### hint\_level Overrides

- hint\_level == 0: always socratic\_style = "conceptual" — regardless of scaffolding\_level
- hint\_level >= 3: check\_in\_required = False — forced attempt means no mid-response pacing

# 12. Misconception Detection

Misconceptions are qualitatively different from knowledge gaps. A student who has never learned a concept needs teaching. A student with an active misconception needs correction — often counter-intuitive correction that directly confronts the wrong model. UpMyRank maintains a 30-entry library and applies a 1.5× mastery penalty when a match is found.

| Field          | Value                                                                  |
|----------------|------------------------------------------------------------------------|
| Library size   | 30 entries covering Physics, Chemistry, and Maths                      |
| Check function | check_for_misconception(response, topic, subject) → Misconception None |
| Penalty        | 1.5× mastery penalty applied to affected concept via EMA               |
| Storage        | misconception_detected=TRUE, misconception_id stored on doubt_block    |
| Trigger        | Runs on every AI response before returning to the student              |

## Example Misconceptions

| Subject               | Misconception                                         | Correct Model                                                                 |
|-----------------------|-------------------------------------------------------|-------------------------------------------------------------------------------|
| Physics (Mechanics)   | Heavier objects fall faster under gravity             | All objects fall at the same rate in absence of air resistance (Galileo)      |
| Physics (Electricity) | Current is "used up" as it flows through a circuit    | Charge is conserved; voltage drops across components, not current             |
| Chemistry (Acids)     | Acids always contain oxygen                           | HCl, HBr, HF contain no oxygen — acidity is defined by H+ donation            |
| Chemistry (Bonds)     | Ionic bonds are stronger than covalent bonds          | Depends on the specific compounds; many covalent bonds are stronger           |
| Maths (Calculus)      | Derivatives only measure the slope of a straight line | Derivatives measure instantaneous rate of change — applicable to any curve    |
| Maths (Probability)   | $P(A \text{ and } B) = P(A) \times P(B)$ always       | This only holds when A and B are independent; joint probability requires more |

# 13. Judge Evaluation System

Every session is scored by a 4-dimension LLM judge (gpt-4o-mini at temperature=0). The judge fires asynchronously after session end via `asyncio.create_task()` — it never blocks the user-facing response. Results power the admin dashboard and the pre-deploy regression gate.

## 4-Dimension Scoring Formula

| Dimension            | Scale   | Weight     | What It Measures                                                                                        |
|----------------------|---------|------------|---------------------------------------------------------------------------------------------------------|
| Pedagogical          | 0-2     | 0.40 (40%) | Socratic quality — did AI withhold answer appropriately?                                                |
| Factual              | 0-1     | 0.30 (30%) | Factual accuracy of the response content                                                                |
| Context Relevance    | 0-1     | 0.15 (15%) | Did AI use the RAG context that was provided?                                                           |
| Hint Appropriateness | 0-1     | 0.15 (15%) | Right level of scaffolding for student's current state?                                                 |
| Overall (composite)  | 0.0–1.0 | —          | $0.4 \times (\text{ped}/2) + 0.3 \times \text{fact} + 0.15 \times \text{ctx} + 0.15 \times \text{hint}$ |

## Judge Pipeline

- Judge fires async from POST /session/end via `asyncio.create_task()` — never blocks user response
- Uses gpt-4o-mini at temperature=0 for deterministic, reproducible scoring
- Input: question (truncated to 4000 chars) + AI response (truncated to 4000 chars)
- Output: {pedagogical\_score, factual\_score, context\_relevance\_score, hint\_appropriateness\_score, overall\_score, rationale\_json}
- Results stored in judge\_evaluations table with FK to both study\_session and doubt\_session
- Admin dashboard aggregates: adherence rate, avg scores, per-topic breakdown, drifting topics (score < 1.5)
- Regression gate (scripts/regression\_gate.py): exit code 1 if overall\_score < 0.6 on golden dataset — blocks deploy
- Pedagogy drift report (scripts/pedagogy\_drift\_report.py): weekly, flags topics with avg score < 1.5

## Admin Dashboard Metrics

| Metric                   | Endpoint                 | Description                                                               |
|--------------------------|--------------------------|---------------------------------------------------------------------------|
| Socratic Adherence Rate  | GET /admin/metrics       | Fraction of sessions scoring pedagogical ≥ 1 (out of 2)                   |
| Avg Retrieval Similarity | GET /admin/metrics       | Mean cosine similarity of top chunk across all sessions                   |
| Latency P95              | GET /admin/metrics       | 95th percentile response latency in milliseconds                          |
| Per-Topic Breakdown      | GET /admin/metrics       | Average overall score per topic — sorted ascending to surface weak topics |
| Judge Score Trend        | GET /admin/judge-metrics | Time series of overall_score over last N days                             |

# 14. Onboarding Flow

New students complete a 4-step onboarding flow before accessing the platform. This is the moment the system's first impressions of the student are formed — the resulting `persona_profile` drives all subsequent pedagogy decisions until the session evidence overrides it.

| Step                   | What's Collected                                                                                                                                                                | How It's Used                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| 1: Academic Background | <code>class_level</code> , <code>physics_prev_marks</code> , <code>chemistry_prev_marks</code> , <code>maths_prev_marks</code>                                                  | Initial scaffolding, level inference, picks subject                   |
| 2: Topic Assessment    | <code>easy_topics[]</code> , <code>hard_topics[]</code> — Physics (36 topics), Chemistry (14), Maths (10) and 36 initial scores (easy=0.7, hard=0.3)                            | Seeds topics, initial scores                                          |
| 3: Study Plan          | <code>study_hours_per_day</code> , <code>exam_type</code> , <code>exam_date</code> , <code>study_priority_subject</code> , <code>learning_style</code> (formula/example/visual) | Study plan, priority subject, learning style                          |
| 4: Persona Summary     | — (display only)                                                                                                                                                                | Shows generated persona card (3-4 sentences describing student model) |

## Persona Builder

- GPT-4.1-mini processes all survey answers and produces the `persona_profile` JSON
- `persona_summary`: 3-4 sentences covering ability level per subject, hint preference, emotional pattern, teaching style
- `scaffolding_level` derived from weakest-subject marks (lowest of physics/chemistry/maths)
- `preferred_style`: set directly from `learning_preference` input — explicit student input is authoritative
- `common_misconceptions`: seeded from `hard_topics[]` based on subject misconception library
- `allowed_hint_depth`: defaults to 3 for first-time students; policy engine can override

---

## 15. Frontend Architecture

The frontend is a Next.js 14 application with TypeScript, Tailwind CSS, and Framer Motion. It uses no Redux — state is managed with local `useState` and `context`. API calls use a custom `fetchWithRetry()` with exponential backoff and automatic token refresh on 401 errors.

### Pages

| Page        | Route        | Purpose                                                                                |
|-------------|--------------|----------------------------------------------------------------------------------------|
| Home        | /            | Dashboard: persona greeting, 3 subject mastery cards, exam countdown, continue session |
| Auth Login  | /auth/login  | Supabase auth + onboarding status check → redirects to /onboarding if not done         |
| Auth Signup | /auth/signup | Always redirects new signups to /onboarding                                            |
| Onboarding  | /onboarding  | 4-step glassmorphic flow: marks → topics → study plan → persona summary card           |
| Doubt       | /doubt       | Main chat UI with SSE streaming, topic lock, subject badge, confidence meter           |
| Practice    | /practice    | Topic-based practice (planned)                                                         |
| Mock        | /mock        | Full mock exam simulation with timer and MCQ interface                                 |
| Progress    | /progress    | Knowledge Genome mastery visualization per concept                                     |
| Settings    | /settings    | 4-tab settings: Profile / My Analytics / System Analytics / Preferences                |
| Admin       | /admin       | System eval dashboard — admin-gated via <code>ADMIN_STUDENT_ID</code> env var          |

### Key Components

| Component         | Purpose                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------|
| ChatMessage.tsx   | Renders AI/student messages with LaTeX via KaTeX, badge display, thumbs up/down feedback buttons                              |
| ChatInput.tsx     | Input + ConfidenceMeter with <code>AnimatePresence</code> swap; base64 image upload via <code>FileReader</code> (no Supabase) |
| Sidebar.tsx       | 280px desktop nav; student identity card (avatar + name + exam); TopicTree; Learning Profile section                          |
| TopicTree.tsx     | Subject tabs (Phy/Che/Mat); chapter accordion with mastery bar; topic row with Doubt/Practice/Mock                            |
| QuickDoubtFAB.tsx | 56px FAB globally mounted; bottom-sheet textarea; navigates to <code>/doubt?q=question</code> ; hidden on <code>/doubt</code> |

### SSE Streaming

The doubt page uses EventSource-equivalent fetch with `ReadableStream`. Every token is yielded as `{"token": "...", "done": false}`. The final event is `{"done": true}` which closes the stream. A keepalive `{"done": false, "thinking": true}` is sent immediately on continuation requests to prevent Render's 30-second proxy timeout from

killing the connection before the LLM call completes.

#### API Client: `fetchWithRetry()`

- Retry delays: 5s / 15s / 30s (covers Render cold start of ~20s)
- Automatic 401 handling: calls `tryRefresh()` to get new access token, retries original request
- If refresh fails: redirect to `/auth/login`
- `pingBackend()`: called on mount of login/signup/onboarding pages to warm Render cold start

# 16. Hard Invariants — The Rules

These 9 rules are hard invariants. Violating them creates silent bugs — the kind that corrupt data over time without throwing visible errors. They must never be broken.

| # | Rule                                                                                 | Why It Matters                                                                                                       |
|---|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| 1 | <code>_genome_update_task</code> is the sole master writer                           | Asynchronous EMA path creates split-brain mastery — student model becomes inconsistent and corrupt                   |
| 2 | <code>summarize_session()</code> is always awaited before <code>session_end()</code> | Fire/session_end breaks the blocking requirement; session must end with summary written to DB                        |
| 3 | Redis errors must never propagate                                                    | Cache is optional infrastructure — a Redis crash must never take down user-facing flows                              |
| 4 | Level 3 = context starvation, not just instructions                                  | LLMs can ignore instructions under pressure. Structural removal is the only reliable enforcement                     |
| 5 | <code>gpt-4o</code> is for vision only, never text                                   | Cost and latency reasons; <code>gpt-4.1-mini</code> delivers equivalent Socratic quality for text generation         |
| 6 | LaTeX sanitizer runs on every LLM response                                           | Malformed LaTeX breaks the frontend KaTeX renderer for ALL users — never send raw output                             |
| 7 | DB migrations are files in <code>scripts/</code>                                     | Ad-hoc <code>ALTER TABLE</code> creates irreproducible schema state across environments — always use migrations      |
| 8 | Admin gate is <code>ADMIN_STUDENT_ID</code> env var                                  | No database, no SQL role changes needed; simple, auditable, easy to revoke                                           |
| 9 | Persona evolution preserves structured keys                                          | Only <code>persona_summary</code> is rewritten; <code>scaffolding_level</code> and other keys survive via dict merge |

## 17. Architecture Decisions

Every major architectural decision was driven by pedagogical requirements, not convenience. This section documents what was chosen, what was rejected, and why.

| Decision            | Chosen                                             | Rejected                      | Reason                                                                         |
|---------------------|----------------------------------------------------|-------------------------------|--------------------------------------------------------------------------------|
| Retrieval strategy  | Agentic RAG (LLM tool selection, MAX_SESSIONS=50)  | Simple, MAX_SESSIONS=50       | Agentic retrieval misses subject context; agent routes correctly between tools |
| Search fusion       | Hybrid RRF (pgvector + PostgreSQL) + pure keyword  | Pure keyword                  | Vector alone misses exact formula names; keyword alone misses context          |
| Mastery tracking    | EMA per concept (Exponential Moving Average)       | Binary (0/1) or Average       | EMA captures learning trajectory and forgetting — not just the latest state    |
| Error fingerprint   | JSONB {error_type: 0.05, ...}                      | Simple error code             | Strength-based model allows targeted remediation and tracks weaknesses         |
| Pedagogy layer      | Separate Policy Engine (rules before LLM)          | Instructions in prompt        | Separation allows deterministic pedagogy decisions that can be audited         |
| Level 3 enforcement | Structural context removal                         | Stronger instructions         | Instructions alone cannot reliably prevent LLM from giving the answer          |
| Session summarizer  | await summarize_session_async(task)                | async(task)                   | Summary must be written before session ends for next-session context           |
| Persona evolution   | maybe_compress_profile(every 5 sessions)           | Review every session          | Session-time GPT call per session too expensive; 5-session batch compression   |
| Database auth       | Supabase RLS on all 10 tables                      | Backend-only auth             | Defense in depth; student_id from auth.uid() prevents horizontal auth bypass   |
| Embedding strategy  | Single embed_single() + start of Agentic Retrieval | Embedding + Agentic Retrieval | Avoids 2 of 3 OpenAI API calls per retrieval; ~60% latency reduction           |
| Image handling      | base64 via FileReader, Supabase Storage upload     | Supabase Storage upload       | Supabase env vars needed on Vercel; simpler, no storage cost                   |

---

## 18. End-to-End Data Flow

The complete journey of a single student question — from keypress to genome update. This is the critical path through every layer of the system.

Figure: Complete end-to-end data flow for a student question

### Step-by-Step Walkthrough

**1. Input:** Student types question in doubt/page.tsx ChatInput. Subject and topic may be pre-set from TopicTree navigation.

**2. API Call:** POST /doubt/ask/stream fires. Body: {question, subject, study\_session\_id, doubt\_session\_id, hint\_level}.

**3. Intent:** gpt-4o-mini classifies as SOCRATIC (or CONTINUATION, EXPLANATION, CONVERSATIONAL, OUT\_OF\_SCOPE).

**4. RAG:** `AgenticRetriever.run()`: embed once → gpt-4o-mini tool selection → parallel `asyncio.gather()` → hybrid RRF → top chunks.

**5. Context:** `build_context_bundle()` pulls: Redis hot context (last 2 summaries) + Postgres compressed\_profile + top 5 weakest concepts.

**6. Policy:** `select_pedagogy(persona_profile, topic, hint_level)` returns `PedagogyConfig`: scaffolding\_level, socratic\_style, max\_concepts, check\_in\_required.

**7. Misconception:** `check_for_misconception(response, topic, subject)` checks against 30-entry library. Match → 1.5× penalty flag.

**8. Prompt:** `build_system_prompt()` assembles full prompt: `TUTOR_SYSTEM_PROMPT` + `CUSTOMIZATION_PROMPT` + `PERSONALIZATION_PROMPT` + student context block.

**9. Streaming:** gpt-4.1-mini streams response token-by-token as SSE events `{"token": "...", "done": false}`.

**10. Sanitize:** `_sanitize_latex()` runs on each chunk before sending to client. Frontend renders with KaTeX.

**11. Resolve:** Student clicks "Got it" → POST `/doubt/hint` with `student_resolved=true` → `_genome_update_task` fires EMA mastery update.

**12. Session End:** POST `/session/end` → await `summarize_session()` (blocking) → `update_hot_context()` (Redis) → `asyncio.create_task(maybe_compress_profile())` (background) → `asyncio.create_task(judge_eval)` (background).

## Knowledge Base Summary

| Metric                 | Value                                                               |
|------------------------|---------------------------------------------------------------------|
| Total knowledge chunks | 15,069                                                              |
| Physics chunks         | 10,505 (Class 11 + 12, all chapters)                                |
| Chemistry chunks       | 3,138 (Class 11 + 12, ingested from KadamParth HuggingFace dataset) |
| Maths chunks           | 1,426 (Class 11 + 12, ingested from NCERT PDFs via pdfplumber)      |
| JEE PYQs               | 20 verified seed problems (Physics + Chemistry + Maths)             |
| Total concept nodes    | 199 (Physics: 84, Chemistry: 62, Maths: 53)                         |
| Embedding model        | text-embedding-3-small, 1536 dimensions, uniform across all tables  |
| Embedding index        | HNSW (pgvector 0.8.2), cosine distance metric                       |
| Text search index      | pg_trgm GIN on content + subtopic columns                           |
| Chunk size             | ~350 tokens with 50-token overlap                                   |
